

# Developer Partner Program

Threat Intelligence Feed Integration

## What is a Threat Intelligence Feed Integration?

Threat Intelligence from an external source is made available in the ThreatConnect Platform

Data maintained externally is brought into the Platform

In-platform Runtime Apps (Python 3) are used in Jobs

Jobs run on a pre-defined schedule

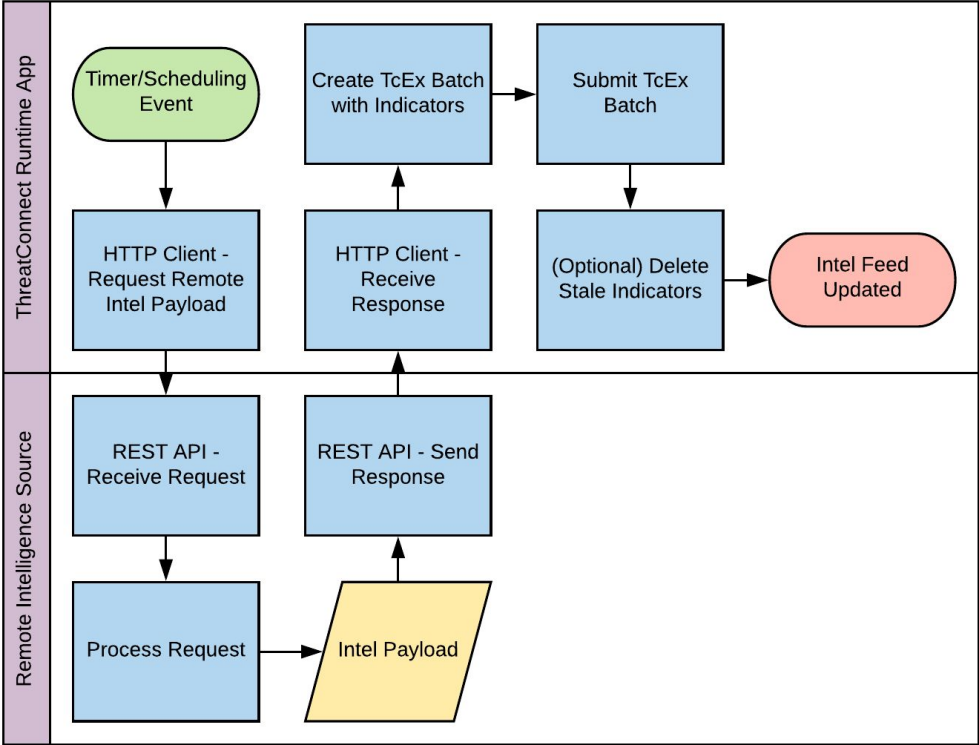

# Platform Installation Types

---

- Public Cloud
  - Multi-tenant mix of free and paid users
  - No Playbooks, cannot change system settings
- Private Instances (majority)
  - Fully private instance maintained by ThreatConnect in cloud infrastructure
  - Fully private instance maintained by the customer on customer infrastructure

# Integration Flow Diagram

## Integration Key Points

---

- All subscription management must be done outside of the ThreatConnect Platform.
  - **We do not manage third-party subscriptions.**
- Data brought into ThreatConnect will have a unique “owner”.
  - **This represents your organization’s data in our data model.**
  - **In our Public Cloud, there will be multiple instances of your data.**
- Threat Rating and Confidence values must align with ThreatConnect best-practices.
  - **We have a blog post to assist.**
- Differential updates and indicator deletions are desired but not required.

## What deliverables are expected?

---

For a typical integration, we look for these deliverables:

Solution Design  
Document

Runtime Package

User Documentation

# Solution Design Document

---

- We provide a Solution Design Document template.
  - **You complete this template.**
  - **Document is meant to remain concise.**
- We'll review together and reconcile any concerns.
  - **We'll provide input on the design and try to guide you towards best-practices.**
- Once reviewed and approved, this document serves as a reference.
  - **Only minor updates are typically required.**
- This document is not published at this time.

# User Documentation

---

- Documentation delivered to customers and ThreatConnect teams.
  - **A lot of information can be taken directly from the Solution Design Document.**
- We provide documentation on what to include in User Documentation.
  - **Practical examples**
  - **Setup/configuration steps**
  - **Support contact information**
- Documentation is published with your integration.
  - **Viewed by mutual prospects and customers.**

# High-Level Development Lifecycle

---

- Install and/or use a Python 3.6 environment.
- Install the 'tcex' module using pip3.
- Create a project directory.
- Run the 'tcinit' command with the template 'job\_batch'.
- Update the code appropriately and unit test within your own environment.
- Package the app using 'tcpackage' and pass to your Solutions Engineer.
- Solutions Engineer installs into the PartnerStage environment and you perform in-platform tests.

## Next Steps

---

- Your Solutions Engineer will provide you with documentation:
  - [Links to Integration Documentation](#)
  - [Links to Solution Design Document Template and Example](#)
- You will begin working through your design and completing the Solution Design Document Template
  - [We're here to support you via Slack and email and can stay up-to-date this way.](#)
  - [We can schedule calls as needed.](#)
- You will complete work on your project and then we'll review together.
  - [We may ask for changes during this process as we iron-out our program.](#)
